The Typo Aid Package (v.0.0.7)

Daniele Ratti

April 21, 2017

Abstract

The typo aid package provides some useful tools in order to provide useful informations regarding the used fonts.

1 Commands

Four commands are provided:

1. `typrintalph` prints the alphabet length

2. `typrintex` prints the ex-height

3. `typrintem` prints the em-width.

The commands follow the same schema, regarding the output:

- the normal, unstarred version of the command outputs to the typeset page

- the starred version outputs to the terminal

- both versions output to the log file, in addition to their normal output.

All of the commands can accept, as their single arguments, a font switch (e.g. `\itshape, \bfseries,…`). This will make them print the features of the selected switch.

1.1 Compatibility and Remarks

The package is compatible with pdfLaTeX, LuaLaTeXand X∃LaTeX, and will accept a font family switch defined via the `fontspec` package.

2 Acknowledgements

I would like to thank: TeXnician, Christian Hupfer, Enrico Gregorio, Joseph Wright, David Carlisle and Barbara Beeton for their support and kind remarks. Please mark that they know nothing about the code inside the package, but provided many useful tips and tools for me to develop this. They cannot be blamed for anything that can be wrong in this package.

3 License and contacts

This package is released under the *LaTeX Project Public License,* version 1.3c or later. See `http://www.latex-project.org/lppl.txt`.

The package is maintained by Daniele Ratti.
